

If  $A$  is diagonalizable, the equation  $A = PDP^{-1}$  can be thought of as a factorization of the matrix  $A$ . If  $A$  isn't diagonalizable, we can use the **singular value decomposition (SVD)** instead.

### Theorem (Singular Value Decomposition)

If  $A$  is an  $m \times n$  matrix of rank  $k$ , then there exist matrices  $U$ ,  $\Sigma$ , and  $V^T$  such that  $A = U\Sigma V^T$  and

- 1  $A^T A = VDV^{-1}$  for some diagonal matrix  $D$ .
- 2  $\Sigma$  is a diagonal matrix. The first  $k$  diagonal entries of  $\Sigma$  are the square roots of the nonzero eigenvalues of  $A^T A$  (the **singular values** of  $A$ ), in decreasing order, and the rest are 0.
- 3 If  $\vec{u}_i$  is the  $i$ th column of  $U$ ,  $\vec{v}_i$  is the  $i$ th row of  $V^T$ , and  $\sigma_i$  is the  $i$ th diagonal entry of  $\Sigma$ , then  $\vec{u}_i = (1/\sigma_i)A\vec{v}_i$ .
- 4 The first  $k$  columns of  $U$  form an orthonormal basis of  $\text{col}(A)$ , and the first  $k$  columns of  $V$  form an orthonormal basis of  $\text{row}(A)$ .
- 5 The columns of  $U$  form an orthonormal basis of  $\mathbb{R}^m$ , and the columns of  $V$  form an orthonormal basis of  $\mathbb{R}^n$ .

## Singular value decomposition (SVD)

$$A = U\Sigma V^T$$

## Reduced SVD

If  $\text{rank}(A) = r$ , then we can take the first  $r$  columns of  $U$  and  $\Sigma$  and the first  $r$  rows of  $V$  in the SVD and it still works!

$$A = U_r \Sigma_r V_r^T$$

## Rank $k$ approximation of $A$

Taking fewer rows and columns of  $U$ ,  $\Sigma$ , and  $V$  gives a good approximation of  $A$  with smaller rank.

$$A_k = U_k \Sigma_k V_k^T \text{ with } k < r$$

This is how the SVD is used for image compression.
